

## Complete digital AV capture and playback solutions for judicial and legislative environments.

The bundled hardware and software solutions, known as PESA ACES, offers robust audio and video capture and management features. PESA's XSTREAM multi-channel hardware solutions capture multiple streams of audio and video from a wide range of devices and formats and offer accurate time synchronization of voice and video elements. Flexible software controls the capture from a simple, user-friendly graphic user interface, and adds sophisticated features like multi-tiered secure file synchronization to redundant storage servers in real-time, indexed multimedia attachments and notes, advanced search functionality and powerful audit and analytics reporting.

### Private and Secure

Granular management controls let administrators assign access to specific recordings and files on a user-by-user basis, meaning only authorized users can access the recordings and attached evidence. Every time anything is done to a case record many parameters are recorded which fully characterize what was done, by whom and when along with many other factors. This provides a robust log associated with that specific case record.

### Add other evidence, like pictures or attachments

Digital media evidence goes beyond audio and video capture. For a complete digital court recording, you need to have all the evidence at your fingertips. You can add any digital file and have it instantly become part of your completed record: photos, emails, scanned documents, PDFs, file logs, spreadsheets, and so on.

### Integrate with existing case management systems

You already have a case management system, why not put it to better use? Integrate with third-party case management systems to give you a customized recording with no data re-entry. Uses the information already entered in your records database, such as case number, scheduled date/time, presiding judge and other participants, and copy it into your docket, saving you the time, effort and risk of data re-entry.

### Quick search capabilities

In the event of an appeal or a retrial or second appearance, you'll need to quickly locate and access previous recordings. The database infrastructure ensures that you can search on a wide range of case information, such as case number, defendant name, presiding judge, date/time, etc., in order to easily locate your recordings.
